

2-JDK installation

Now it's time to install JDK, without which we cannot run our IDEs, so let's start with the first step: open the file, which is downloaded, and unzip it.

The next steps include checking the version installed in our Windows machine by visiting the command prompt just by typing

`java -version`

```
Microsoft Windows [Version 10.0.19045.2251]
(c) Microsoft Corporation. All rights reserved.

C:\Users\navin>java --version
java 17.0.5 2022-10-18 LTS
Java(TM) SE Runtime Environment (build 17.0.5+9-LTS-191)
Java HotSpot(TM) 64-Bit Server VM (build 17.0.5+9-LTS-191, mixed mode, sharing)

C:\Users\navin>_
```

Which will then display the current jdk version installed on the system. Now let's check the javac, i.e., the compiler version.

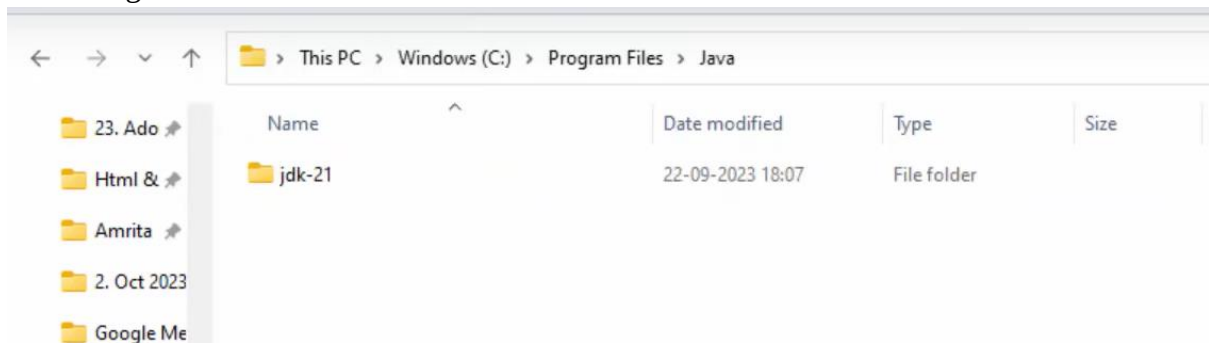

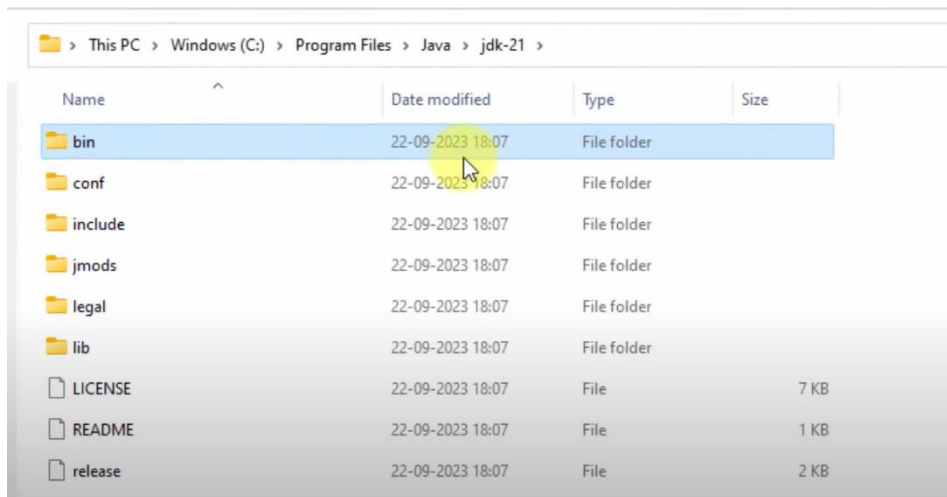

```
C:\Users\navin>javac --version
javac 17.0.5

C:\Users\navin>_
```

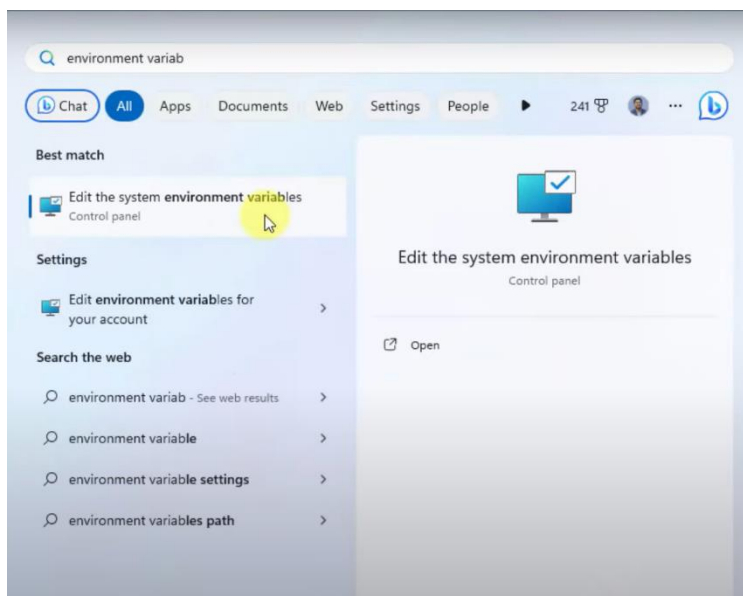

If we encounter problems with the commands, then it refers to that our environment variable path is not set properly, so let's do that.

Simply navigate to the bin folder and copy the complete path from the file you downloaded containing our JDK file.

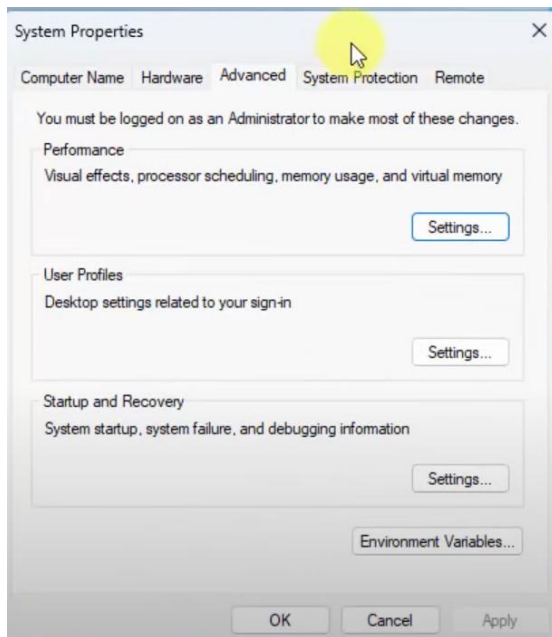

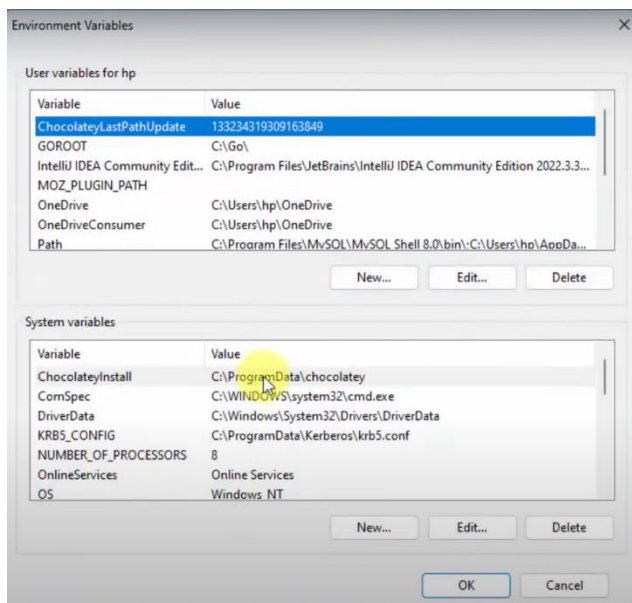

1. In Windows, go to the search bar and search for environment variables.

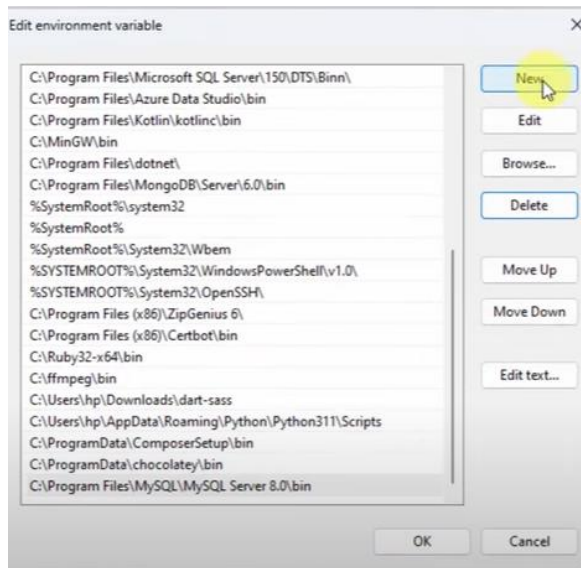

2. Press Enter to display the environment variable selection.

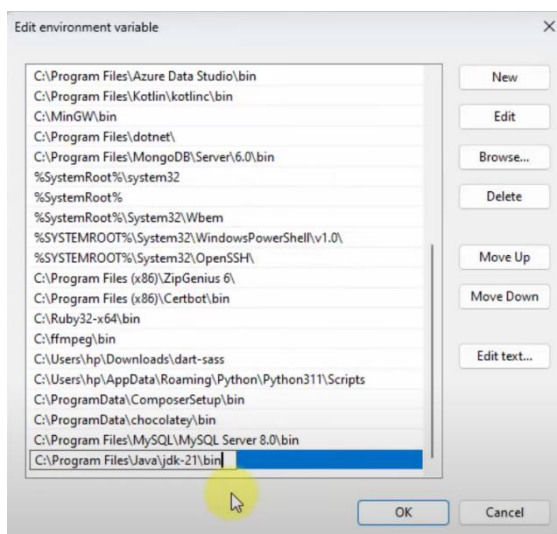

3. There are two options here: one is for the user and the other is for the system.

4. Click on the path option in the system option. Several paths will be visible to you immediately after clicking on it.

5. After selecting "New," you must paste the path that you copied.

6. Click "OK," and your environment variable path is set.

Now, enter the command "java -version in cmd to verify that the path to your JDK version is set.
